CO1 – AT1

Name :- G. Harendra

Reg No : 192521215

CODE : ITA0501

COURSE : COMPUTER VISION

1) Sampling:-

→ Sampling means deciding how many pixels are used in the Image.

→ If there are fewer pixels small objects look unclear. Increasing the Image resolution improves the detail.

2) Dark and noisy image:

→ Use brightness enhancement and noisy removal.

→ This makes dark image brighter and remove the unwanted noise.

3) Quantization:-

→ Quantization helps to convert the continous brightness values fixed pixel values.

4) Image enhancement:- (Segmentation):-

→ Segmentation separates the image into road, vechicles and peoples.

4) Uneven lighting :-

→ use contrast enhancement.
→ defects more visible by improving the difference between light and dark areas.

5) Image Segmentation :-

→ Segmentation separates the image into roads, vechicles and peoples.

6) Edge detection :-

→ Edge detections helps to find the boundaries or Edges in the images.
→ cracks have edges, so this helps to find Cracks in products.

7) Noise removal :-

→ use a median filter to remove noise.
→ It makes the image clearer and helps doctors see the tumor better.

8) object detection :-

→ object detection finds vehicles in the camera image.
→ It helps monitor traffic and the traffic problems.

9) Blurred image :-

→ Caused by movement of the object while taking the photo.

→ A deblurring technique can make the image clearer.

10) Image classification :-

→ Image classification separates products into good or defective products.

→ It helps factories automatically check the product quality.
