Computer vision.

Activity -1

1)

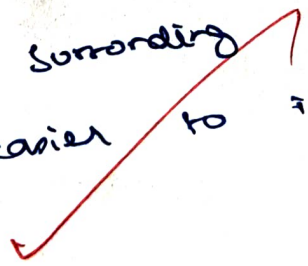

Medical image Enhancement :-

→ I recommend contrast stretching to improve the X-ray image.

2) Suitable :-

contrast stretching. increases the difference between dark and bright pixels. It helps doctors sees the tissues more clearly.

3) The image will have better contrast, and the details of bones and surrounding tissues will become easier to identify.

2) night-time Surveillance :-

→ I recommend log tranformation. to improve the visibility of the dark parking lot.

→ Log transformation. increases the brightness of dark pixels and reveals hidden details.

→ Negative transformation reverses the brightness of the image but does not specifically improve dark regions in the same way.

→ The parking lot will appear brighter, and objects such as vehicles, and people will become easier to identify.

3) Fingerprint Recognition:-

→ Transformation :- contrast stretching.

→ why? :- It increases the contrast between fingerprint ridges and valleys.

→ It brightens dark areas but may not improve ridge contrast as effectively.
